NG3 protease (Fragment).
Hepatitis C virus.
Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;
SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED HY LIPOPROTEIN BUNELOPE. CONSISTS OF TWO PROFINS: PROFIEN AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROFIEIN C. AND MRNA (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ċ

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

genome polyprotein - hepatitis C virus (isolate EUK1480)
N:Contains: capsid protein C; envelope protein M; hepacivirin (EC 3.4.21.98) (nonstru protein NS4s; nonstructural protein NS5)
C; Species: hepatitis C virus
C; Species: hepatitis C virus
C; Date: 19-May-2000 *text_change 19-Jan-2001
C; Accession: JC5520
B; Chamberlain, R.W.; Adams, N.J.; Taylor, L.A.; Simmonds, P.; Elliott, R.M.

C:Species: hepatitis C virus

```
Octobrance polyprotein - hepatitis C virus (isolate HC-J6)

Wicontains: capsid protein C; envelope protein M: hepacivirin (EC 3.4.21.98) (nonst protein NS4s; nonstructural protein NS4s; nonstructural protein NS4b; nonstructural protein NS5

C;Species: hepatitis C virus

C;Species: hepatitis C virus isolated from C;Accession: J03303

A;Mclecule vipe: genomic RNA

A;Ritle: Nucleotide sequence of the genomic RNA of hepatitis C virus isolated from A;Accession: J03303

A;Mclecule type: genomic RNA

A;Residues: J033 000844; NID:9204440; PMID:1658196

A;Mclecule type: genomic RNA

A;Residues: J033 000844; NID:9221650; PIDN:BAA00792.1; PID:9221651

A;Reperimental source: isolate HG-J6 from a Japanese individual

C;Superfamily: hepatitis C virus genome polyprotein;

/seeds were surface sterlized then germinated under axenic
conditions in the dark at room temperature on filter paper
with water, nystatin and cefotaxime in covered
crystallization dishes. Five-day old seedlings were
crystallization dishes. Five-day old seedlings were
incubated at 90% RH for 24 hr. Shoots were then harvested,
total RNA was prepared, poly(A) RNA was purified, one
primary unamplified cDNA library was made, 600000 pfu were
in vivo excised to give pBluescript SK(-) cDNA phagemids.
These steps were performed in the TJ Close laboratory at
the University of California, Riverside (Choi, Close,
Fenton). Phagemids were plated and picked at the Clemson
University Genomics Institute (CUGI) (Begum, Palmer,
Frisch, Atkins and Wing). Plasmid DNA preparations, DNA
sequencing and sequence analysis were performed at CUGI
(Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main).
The sequence has been trimmed to remove vector sequence
and contains a minimum of 100 bases of phred value 20 or
sequence for more details on library preparation and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treamments of HCV infection. This is useful as HCV can load to chook it invention concerns a number of NS3 mutants and NS3-NS4A
                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                                                                                                                                                                                      9
substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                                                                                                                                                                          1 MKKKGSVVIVGRIVLNGAYAQQTRGEEGCQETSQTGKDKNQVEGEVQIVSTAAQTFLATC

```
The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HVV) NS3 and NS4A protease enzymas. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. This sequence contains the alpha-helix0-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         119 LVTRHADVIPVRRRGDSRGSLLSPRPISYLKGSSGGPLLCPAGHAVGIFRAAVCTRGVAR 178

                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                   The present sequence is a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis. Liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor

The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HVV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of the two proteins should be effective as antiviral treatments of the infection. This is useful as HCV can lead to chronic liver disease such as cirthosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A well as enabling structural studies of the protease and proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease: inhibitor complexes. This sequence contains the alpha-helix0-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  119 LVTRHADVIPVRRRGDSRGSLLSPRPISYLKGSSGGPLLCPAGHAVGIFRAAVCTRGVAK 178
